STAT3007/7007 Project Report Template

Group X
Issac Newton (s12345678) · Albert Einstein (s23456781) · Alan Turing (s34567812)
John von Neumann (s45678123) · Kurt Gödel (s56781234)

Abstract

This is a LaTeX template for your project report. Note the following: (a) Change the title and group information above to your project title and group information. (b) Your report should not exceed 12 pages (excluding the references and appendices). You can change the section titles, but you should not alter the font size or the page size. It is perfectly fine to use less then 12 pages and conciseness is a marking criterion. (c) You may find it helpful to take a look at some NeurIPS papers at `https://papers.nips.cc/` and mimic their writing style. (d) You can do collaborative writing by uploading the template to Overleaf: download *STAT3007-7007_Project_Templates.zip*, login to `https://www.overleaf.com`, click *Upload Project*, then upload the zip file. Overleaf provides excellent guides on LaTeX at `https://www.overleaf.com/learn`. Often, a quicker way to get the answer to a LaTeX question is to ask ChatGPT; in many cases, it can give you a correct answer without much prompting. (e) When you submit your report, name it in the format of *GX_report_AlanTuring.pdf*, where *GX* should be replaced by your group name, and *AlanTuring* by the submitter's name. Only one group member needs to submit. (f) Have fun writing a nice report for your project findings.

1 Introduction

Describe your problem with a discussion on relevant background, motivation, and significance in this section.

2 Related Work

Provide a discussion on related work in this section. Use `\citet` to produce textual citations, and `\citep` to produce parenthetical citations, as illustrated below:

- **mcculloch1943logical** proposed the linear threshold neuron as a mathematical model for biological neurons.
- One of the first mathematical models for biological neurons is the linear threshold neuron (**mcculloch1943logical**).

3 Methods

Describe your methods in this section. You should provide sufficient details so that your work is reproducible.

4 Experiments

Describe your experiment settings, datasets used, the results that you obtained, and provide a discussion on the results. You should present your results in a concise manner. For example, if you would like to include the learning curves for several algorithms, generally you should present the curves in a single figure, rather than producing one figure for one algorithm. Similarly, it is better to having a single table comparing the performance of several algorithms, rather than having one table for each algorithm and scattering them across your report.

5 Conclusion

Write your conclusion in this section. You can discuss the limitations of your project here.

Contribution

State the contribution of each group member. Below is an example.

- Newton: designed, implemented and evaluated method A; drafted content related to method A.
- Einstein: implemented and evaluated method B; drafted content related to method B.
- Turing: reviewed the literature and wrote Related Work.
- Neumann: collected and processed the datasets, set up the experiment environment; drafted content on these.
- Gödel: compiled and polished the report.

Acknowledgement

If anyone not in the group has collaborated with or advised you on the project, you should fully acknowledge their contribution.

Appendix A.

You can include any additional materials in one or more appendices. Note that you should have all your key messages in the main text, and the materials in an appendix should be supplementary but referenced in your main text. At most 5 pages are allowed for the appendices.

Indicate whether all your group members consent for your report to be used as a teaching resource by including one of the statement below.

We give consent for this to be used as a teaching resource.
We DO NOT give consent for this to be used as a teaching resource.
